

How Partner Preference Matching Works

A simple guide for MyMatch.lk members

What is this?

When you use **Preferred Search** or see **matched profiles**, the system compares your partner preferences with another person's profile and gives a **match percentage** (from 0% to 100%). A higher percentage means they fit your preferences better.

The simple idea

Think of it like a checklist with points. Each preference you care about has a certain number of points (its **weight**). If the other person matches that preference, you earn those points. At the end, we turn your points into a percentage.

Match % = (points you earned / points that apply) x 100

Preference weights (points)

These are the points each preference is worth when you have filled it in on your profile:

Preference	Points	What it means in plain language
Age range	20	Are they within the age range you want?
Religion	20	Does their religion match what you prefer?
Country of residence	10	Do they live in a country you prefer?
Eating habits	10	Does their diet match (for example vegetarian)?
Drinking habits	10	Is their drinking within what you accept?
Smoking habits	10	Is their smoking within what you accept?
Education / qualification	10	Do they meet your minimum education level?
Country of origin	10	Is their origin country one you prefer?
Ethnicity	10	Does their family ethnicity match your preference?
Complexion	10	Does their complexion match what you prefer?

Total if you set every preference: $20 + 20 + (10 \times 8) = 120$ **points**. Your percentage is calculated only from the preferences you actually filled in.

Important rules (easy version)

- **Only what you fill in counts.** If you leave a preference blank or choose "Any", it is ignored - it does not lower your match %.

- **Age and Religion are most important** (20 points each). Everything else is 10 points.
- **If you set no preferences at all** in Preferred Search, everyone shows as 100% (you are open to all).
- **Unknown details** (for example age missing) are usually treated as acceptable, so people are not unfairly marked down.

Special rules in everyday words

Drinking and smoking

These use levels: **Never -> Occasionally -> Frequently**. If you prefer "Never", only someone who never drinks/smokes (or has not said) will match. If you prefer "Occasionally", Never or Occasionally is OK. If you prefer "Frequently", all levels are OK.

Education

Your choice is a **minimum**. If you want "Degree", then Degree, Masters, or PhD all count as a match. A lower level (for example A/L only) does not.

Ethnicity

We check the other person's father or mother ethnicity. If either matches your preference, it counts.

Example

You set only three preferences: Age (20), Religion (20), and Drinking (10). So the maximum for you is **50 points**.

- Age matches -> +20
- Religion does not match -> +0
- Drinking matches -> +10

Points earned = 30. Match % = $30 / 50 \times 100 = 60\%$

Two ways matching is used

Preferred Search	Matched profiles
Looks only at your preferences vs their profile (one direction). Blank preferences are skipped. This is the percentage you usually see when searching with preferences.	Looks both ways: how well they fit you and how well you fit them. If only one side matches on a preference, that preference gives half points.

Tip: Fill in the preferences that matter most to you. Age and religion carry the most weight. Leaving something as "Any" means you are open on that point and it will not affect the percentage.
